A "sexed up", but good basic meteorology textbook

By HC Mitchell

This is a repackaged version of Ahren's Meteorology textbook, with a stronger focus on extreme weather. Pretty much ALL the examples and applications are focused on storms and other extreme events. This may make the book more palatable to some students, though an aspiring meteorologist should probably stick with

the "Scientists and Engineers" version of Ahren's original book. Like his other work, the photos and diagrams are superb, and the explanation is very clear. The examples of historical extremes are also greatly increased.

The "Climate" side of the book is just one chapter, with a short section at the very end about how climate change might affect extreme weather. Ahrens makes it very clear that while there may be some dramatic changes, existing Science doesn't really tell us what will happen. I found the treatment of climate science to be very cautious and appropriately mainstream (shouldn't introductory textbooks be mainstream?). The low reviewer apparently doesn't live on a planet where scientific consensus is a reasonable guide to thought. On Earth, this is quite good basic Meteorology book.

Geography 115 Text

By Leslie A. Grenier

Required text for a upper division GE Geography Class. This was not my first choice in this particular areas of GE study. However, this has turned out to be a very good class with the text being easy to understand and read.

Expensive substandard book

By Jean-Jacques Malosse

I already purchased the book from Pr.Dr. Ahrens "Meteorology Today": An Introduction to Weather, Climate, and the Environment, 9th Edition. I had a poor opinion of that book. The book Extreme weather and climate is still outrageously expensive (\$171) it is heavy (508 pages) and it has no equations. This book presents meteorology like a pseudo-science as it used to be in the nineteenth century. Just looking at page 140 of the book there is an issue: Figure 5.25 shows altocumulus floccus and not altocumulus castellanus. The author apparently ignores the definitions from the International Cloud Atlas. As a teacher it is his duty to give the official definition and if he deviates from it, he must say so. A castellanus is a cloud having a shape of a tower and not a ball and usually, castellanus form a continuous line. It is again a book of poor quality and not worth its price. Again, I remind that Pr.Dr. Ahrens was professor at Modesto Community college.
